Software Load Balancer BalanceNG® available for Mac OS X

Gruenwald, March 3, 2015:

Inlab Software announces the immediate availability of the software load balancer BalanceNG for Mac OS X Mavericks and Yosemite operating systems. This makes it the first commercial general purpose software load balancer running natively on the Mac OS X platform.

About BalanceNG®:

BalanceNG is a modern, multithreading software load balancer available for Linux, Mac OS X and Solaris operating systems. BalanceNG utilizes its own highly specialized IP stack for IPv4 and IPv6 and implements an independent active/passive cluster environment based on VRRP and the "bngsync" session table synchronization protocol.

Key features are its outstanding packet processing performance and its easy integrability in datacenter networks and OEM product lines which make it the perfect choice for network operators, hosting companies and Telco product designers.

About Inlab Software:

Inlab Software GmbH, founded in 1991 is an ISV (Independent Software Vendor) located in Gruenwald near Munich, Germany. Inlab focuses on load balancing software, networking system software, security software and programming languages. Inlab develops commercial products and Open Source Software for Linux, Mac OS X and Solaris operating systems.
